Career Goals

Computer Engineer

Computers and how they work have captivated my interest since I was a mere 4 years old. This interest soon morphed into an aspiration to become a computer engineer, combining software and hardware into one. To achieve this dream, I will partake in many educational activities including courses at schools, competitions/olympiads outside, internships/research, and courses outside of school. This will help me get into a good university, where I will major in computer engineering while making most of my time there by learning as much as I can. This will eventually lead to my application for computer engineering jobs where I will hopefully get the job.

Strengths and Experience

I have moved a lot due to my father's career requiring him to move around. I have been put in many environments and have adapted to new scenarios and areas.

However hard the task is, when I am working on something I will finish it in the appropriate time. This applies to everything I do whether it's coding or something else.

I have been on a robotics team with many clashing views. At first it was difficult to work with these collaborators, especially to agree on something when everyone wanted to do it their way, but we eventually made a system and learned how to work together. I learned how to make compromises.

For this career, I am able to adapt to new coding environments and languages, persevere to achieve a goal or finish a project in an allotted time, and collaborate to reach compromises and work with people. These

are all important skills to be successful in the engineering world.

Achievements

I am working on projects for the International Science and Engineering Fair and am also preparing for the United States of America Computing Olympiad. I have had a 4.0 GPA in all of high school so far.
